Table of Contents

Introduction

Client and Intended Users

This report is prepared for Marty Campbell, Pierce County Assessor-Treasurer. Other intended users include the Pierce County Board of Equalization, the Washington State Board of Tax Appeals, and the Washington State Department of Revenue. No other users are intended or implied.

Intended Use

The intended use of this appraisal is for administration of ad valorem taxation. After certification by the Assessor, these values will be used as the basis for assessment of real estate taxes payable in 2026. We do not intend the values to be used for or relied upon for any other purpose. This report serves as a record of the revaluation which is subject to review and change by the County Board of Equalization, the Washington State Board of Tax Appeals, and the courts. The assessor intends that this report conform to the Uniform Standards of Professional Appraisal Practice (USPAP) requirements for a mass appraisal report as stated in USPAP Standard 6. To fully understand this report the reader may need to refer to the Assessor's Property Record Files, Assessors Real Property Data Base, separate studies, Assessor's Procedures, Assessor's field maps, Revaluation Plan and the statutes.

Date of Appraisal

The effective date of appraisal: **January 1, 2025**
This report was completed as of: **June 12, 2025**

Valuation Standards

For ad valorem tax purposes, the Pierce County Assessor-Treasurer is required by law to annually list all property as of January 1st of each year at one hundred percent of the true and fair market value of land and improvements. County assessors are authorized to place any property that increased in value due to new construction on the assessment rolls up to August 31st of each year at the true and fair value as of July 31st of that year.

Mass appraisal standards are used to establish assessed values. The definition of Mass appraisal is "the process of valuing a group of properties as of a given date, using standard methods, and allowing for statistical testing[1]". Sales from the previous year(s) are statistically analyzed to establish new land and improvement values and evaluate the accuracy of the assessments.

Property Records

Property assessment characteristic records are maintained for all properties in Pierce County. These records are established when parcels or improvements are initially added to the assessment rolls. Characteristics such as building square footage, style, quality, and condition are used to establish improvement records. Improvement records usually include buildings sketches and photos.

[1] Source: Property Assessment and Administration; The International Association of Assessing Officers; Editors, Joseph K. Eckert, PH.D, Robert J. Gloudemans & Richard R Almy

Characteristics such as land size, amenities, and functional issues are collected to establish land records. Pierce County is on a six-year physical inspection cycle, meaning one sixth of the county is subject to physical inspection each year. During the physical inspection cycle, an appraiser observes the property and verifies that the assessor's property characteristic data is accurate. When changes are made to pertinent characteristics (examples: new construction, condition changes, demolition, etc.) the property is reappraised.

Location Analysis

Pierce County is divided into 18 appraisal areas (AA) for the purpose of analyzing sales data and market trends. AA maps are provided in this report. These appraisal areas are further divided into 265 smaller economic areas. They are referred to as Land Economic Areas (LEAs) for land data and Neighborhoods for improvement data. LEA and Neighborhood boundaries are identical for residential properties. Stratification of sales by appraisal area and LEA/Neighborhood isolates differences in the physical, economic, governmental, and social factors influencing real estate values. Land and improvement values are adjusted at the LEA/Neighborhood level to take into consideration these different market conditions. After final values are established, sale data is compiled and reviewed for accuracy and uniformity of the results. The results are in located in this report.

The 2025 revaluation report is prepared to assist staff in answering questions from property owners regarding value changes. It also provides evidence to the County Board of Equalization in support of the assessed values. The report summarizes value change percentages and documents the sales statistics measuring assessment level and uniformity. Value change information is presented for the entire county, then by appraisal area, LEA/Neighborhood, city, school district and fire district. Sales statistics are summarized to provide an indication of the accuracy of the assessed values for the entire county, then by appraisal area, LEA/Neighborhood, property type and construction quality.

Revaluation Process

The cost approach adjusted by market sales is used in Pierce County to value improved residential property. In the cost approach, the replacement cost new of the improvement is first determined. Depreciation from physical wear and tear and from functional and economic obsolescence is subtracted from the replacement cost new to determine the remaining improvement value. Marshall & Swift cost rates provided by our CAMA software vendor are utilized as the basis for the cost approach[2]. For the 2025 revaluation, cost rates were trended based on June 2024 2nd quarter cost data. It is noted that cost rates are either trended annually or replaced with new rates. Replacement of rates may create value changes - *not associated with normal market trend* - between different property types, qualities, and sizes due to market demand and pricing changes.

The Statistical team determines whether there is a need to adjust construction costs and depreciation tables for any given appraisal year. Depreciation is calibrated periodically from sales analysis within Pierce County rather than using Marshall & Swift tables. For 2025 assessments, all Residential

[2] Marshall and Swift cost rates are provided with our Computer Assisted Mass Appraisal (CAMA) system, by the vendor, Harris Govern, Inc. Marshall and Swift, owned by CoreLogic is a nationally recognized provider of cost rates for the appraisal industry.

depreciation, including Mobile Homes, Townhomes, Multiple Unit, Triplex and Duplex were re-calibrated and updated to reflect market demand by testing against sales. Depreciation changes may also create value changes - *not associated with normal market trend* - between varying ages of improvements.

New land rates are developed for areas physically inspected during the revaluation year, based on the land characteristics of sales in those areas. Land values are determined by analyzing vacant land sales and residual land values from sold improved properties (Land Residual Value = Sale Price – Assessor's improvement value based on time-adjusted cost rates. For the 2025 Physical Inspection cycle, land models were developed for the LEA/Neighborhoods of Appraisal Areas 03 (Sumner, Bonney Lake, Lake Tapps and Auburn), 04 (Edgewood, Fife, Milton and Northeast Tacoma), and 09 (Puyallup and unincorporated areas east of Tacoma from River Road to Highway 512). See maps for AA boundaries. Appraisal staff completed all required physical inspections.

The final step in the reappraisal process involves the market adjustment of land and building values at the LEA and Neighborhood level. Sales of improved properties are compared to the values produced by the cost approach. The ratio of assessed value to sale price (AV÷SP) provides the information needed to determine the accuracy of the assessed values. Sales ratio analysis is done by adjusting the land and building assessed values of sold properties until an acceptable level and uniformity of the sales ratios is achieved. Final land and building values are added together to arrive at the total value of the property.

Assessed Value Change

Year 2025 Assessed Value Changes

As a result of the 2025 revaluation, changes were made to the assessed values of most residential properties. ***Please note that percent change statistics were generated on the date of this report and may be subject to change over time as during the appraisal process, assessment data can change.*** Overall residential assessed values increased an average rate of 3.10%, compared to last year's overall increase of 6.20%. Increasing market values can be attributed to demand due to limited housing supply.

It is important to note that sale and assessed value statistics presented in this report are averages. Due to unique market conditions, individual property values may have changed substantially more or less than the average for any given area. Assessed values within different cities, unincorporated areas, school districts, and appraisal areas may also have changed to varying degrees above or below the average. This variation is attributed in part to supply and demand factors that differ between areas of the county, and due to influences, such as proximity to employment centers, freeway access, supply of available housing and housing demand spilling over from King County. Neighborhoods or property types with higher concentrations of housing in high demand - including entry level priced areas and multi-family units - are also likely to experience stronger demand.

Property specific value changes can result from the reappraisal of a property that had been under-assessed or over-assessed in previous years. Lack of sufficient numbers of sales in past years can create circumstances where assessed values differ from market values. As a result, when assessed values are moved to current market levels, significant changes can occur. In certain cases, land and/or building values can change significantly more or less than the average. As a result of these changes, some properties may have experienced a redistribution of the total assessed value between land and improvements. In these situations, it is more appropriate to compare the **total change in property values** from prior year to the current year.

It is also important to remember that we appraise property at its fair market value as of January 1 of the assessment year, regardless of the overall change in assessed value that may result. Sales occurring between January 1, 2024, and January 31, 2025 were analyzed to establish the January 1, 2025 value. Sales from January 2025 are excluded from our ratio statistics because market changes experienced since January 1, 2025 are not the subject of this revaluation report. Sales in the 2025 calendar year will be used to develop the assessments for January 1, 2026.

Assessed Value Changes by Property Type and Year

An overall change in the assessed value of residential property types is indicated in the following chart[3]. Percent change is calculated by comparing the aggregate assessed values for each year. The previous year's change is also shown for comparison. An overall sales trend in the report. The percent may differ from the trend to maintain an acceptable assessment level.

	2024-2025	2023-2024
Mobile Home (Land Leased)	5.10%	8.40%
Mobile Home (Land Owned)	3.30%	6.50%
Townhomes (Condos)	2.90%	6.40%
Multi-Units (2 to 4 units)	2.80%	6.50%
Single Family Residences	3.10%	6.20%
Land (Vacant)	3.40%	3.80%
Overall	3.10%	6.20%

The report shows the 2024/2025 change in the average assessed value of residential property within various geographical areas of the county. Percent change by AA maps are also included. The report displays overall average assessed value change for the county, appraisal areas and LEA/Neighborhoods by property type. Percent Change statistics are also available by City, School and Fire District.

Certain properties experiencing value changes are excluded from the analysis because the value change is not considered part of the normal market trend. Exclusions include circumstances such as boundary line revisions, new subdivisions, changes in use classification and new construction value added. These properties are not included when calculating the average assessed value or the percent change in total assessed value for a given area.

[3] Percent change is as of the date of this report and is subject to change.

Prior Year Sales Statistics

Criteria and Definitions for the Residential Revaluation Report

Sales Criteria

- Only Valid sales are included (not all have been confirmed). Sales used are assumed to be "fair market value" as determined by assessor policy and/or State of Washington guidelines.
- Values for multi-parcel sales are summed to one line.
- For multi-parcel sales the 'predominant' use is based on the abstract with the highest value.
- Sale date range 01/01/2024 to 12/31/2024.
- Ratio = Assessed Value divided by Sale Price.
- Sales with ratios below .25 and above 1.75 are excluded.
- Land sales improved since the sale are included using only current land value (building value removed).

Property Use Definitions (based on predominate use)

Mobile Home (Land Leased) – manufactured home located on leased land (1152 Abstract).
Mobile Home (Land Owned) – manufactured home located on land owned (1152 - 1155 Abstract).
Townhouse - site built housing sharing a common interest in the land. (1401 – 1404 Abstract).
Multi-Family - 2-4 unit site built housing (1102 – 1104 Abstract).
Single Family - site built, modular housing only. (1101 Abstract).
Vacant - any real property with 0 improvement value (typically 9100 Abstract).

Measures of Central Tendency

Mean – is the average value or ratio. Computed by summing the values and dividing by sample size. More affected by extreme values than the median.
Median – is the midpoint or middle value or ratio. Note: If the number of data items is even, the median is the midpoint between the two middle values.
Weighted mean – is an aggregate ratio, weights each ratio in proportion to its sale price. Sum of assessed values divided by the sum of sale prices.

Measures of Uniformity

Standard Deviation – square root of the variance, assuming a normal data distribution.
Approx. 68% will lie within +/- 1 standard deviation of the mean
Approx. 95% will lie within +/- 2 standard deviation of the mean
Approx. 99% will lie within +/- 3 standard deviation of the mean
Price Related Differential (PRD) - calculated by dividing the ***mean*** by the ***weighted mean***.
PRD > 1.03 indicates relative under appraisal of higher value parcels (assessment regressivity)
PRD < 0.98 indicates relative over appraisal of higher value parcels (assessment progressivity)
Coefficient of Dispersion (COD) - Represents the average percent difference from the ***median*** most widely used measure of uniformity in ratio studies. IAAO standards are:
10.0 or less for properties in newer relatively homogeneous areas
15.0 or less for properties in older, heterogeneous areas
20.0 or less for vacant land.

Overall County Analysis of Residential Appraisal Results

The 2025 Residential Revaluation report is based on January 1, through December 31, 2024 sales data (Prior Year Sales). For assessment purposes, only valid sales meeting the definition of "fair market value" are used for annual value trending and measuring overall assessment level and uniformity results. ***Please note that sales statistics were generated on the date of this report and may be subject to change over time as during the appraisal process, assessment data can change.*** This year 10,524 sales were analyzed: an increase over last year's total of 9,975 sales. All residential property types, including mobile homes (land owned and land leased), townhomes (condos), multi-family units, single-family dwellings, and land (vacant). Waterfront and view properties are included within those categories. The 2024 sales used for neighborhood trending can be found on the Residential Sales tab. The sales statistics are presented overall countywide by appraisal area, property type, construction style and quality. Ratios (AV ÷ SP) are categorized by Mean, Median (Med) and Weighted Mean (WtdMn).

Sales with ratios (assessed value divided by the sale price) of less than 25% or greater than 175% are excluded from the study based upon the Department of Revenue state ratio parameters. Sales that do not appear to be arms-length transactions and fall within the 27 deletion categories as defined by the Department of Revenue are excluded. Sales with changes to the building characteristics since the time of sale are also excluded as the current assessed value is not representative of the property that sold. Valid land sales, where buildings have been added since the sale, are included using the current land value only.

Market Trend Measured by Sales

Comparing the monthly trend of the relationship between residential property sale prices and their assessed values is another way of judging the accuracy of the revaluation. By comparing the month-to-month change in the average ratio of sale price to assessed value (SP ÷ AV), the trend in the market can be determined. As part of the revaluation process, the assessor uses sale prices trended to the lien date. Ratio statistics in this report do not use trended ratios. Trend charts are included with Residential Sales data in the report. ***Please note that accurate trend requires sufficient sales counts and results may be skewed on criteria with limited sales***. The trend for all categories indicates an overall increase in sale prices.

The following table compares the countywide changes in assessed value of the different residential property types to the Overall Market trend[4]. ***Please note that trend data were generated on the date of this report and may be subject to change over time as during the appraisal process, assessment data can change. Due to limited sales in some property types, trend results may not be reliable. The*** percent change may differ from the trend due to the need to maintain the statutory assessment level.

	Market Trend	Value Change
Mobile Home (Land Leased)	1.71%	5.10%
Mobile Home (Land Owned)	1.91%	3.30%
Townhomes (Condos)	4.90%	2.90%
Multi-Units (2 to 4 units)	1.35%	2.80%
Single Family Residences	1.31%	3.10%
Land (Vacant)	0.07%	3.40%
Overall	1.54%	3.10%

[4] Trend data and percent change data is as of the date of this report and is subject to change.

Viewing the Data

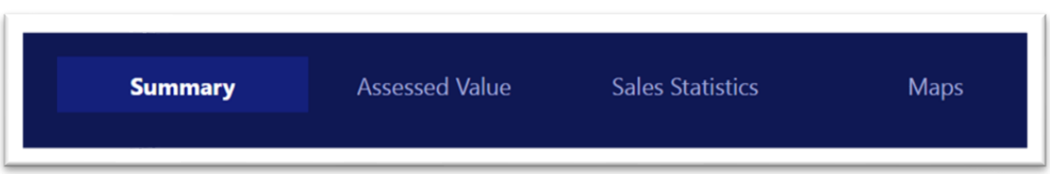
Interactive Report (PowerBI)

For a deeper look at the data, we have made an interactive report available online. There you will find pages for Assessed Value Change, Sales Statistics, and County Maps. The online report will allow you to choose different ways of summarizing as well as allow you break the data out by property type. We've included a few examples of the online report tables below.

Access the online report here: PowerBI

How to Navigate the Web Report

1. Select a page (Assessed Value Change, Prior Year Sales Statistics, or County Maps) from the **Pages** pane on the top right, or from the buttons on the landing page.



2. On the Assessed Value Change or Prior Year Sales Statistics screen, you can choose a data summary using the gold **Summarize by** dropdown.

Residential Revaluation Report
